Hybrid Approach To A Distal Arch Aneurysm

Dr Jacob Jamesraj

The Madras Medical Mission, Chennai, India.

A 63 year old gentleman presented with a saccular aneurysm of the arch of the aorta. He had vocal cord dysfunction from pressure on the recurrent laryngeal nerve which led to the diagnosis. We planned to place a covered stent across the mouth of the aneurysm. The arch was diseased needing a zone zero landing. He had significant iliac disease too.

Surgical debranching was done and a graft was sewn onto the ascending aorta to facilitate the stenting A covered stent was placed across the mouth of the aneurysm from the ascending aorta to the descending aorta. Patient recovered well and is fine on follow up Hybrid procedure decreases the morbidity in tackling suitable arch aneurysms
