INTRODUCTION

Planning for whole presurgery preparations are related to the safety of operation of patients. If this planning has some shortcoming, the process will endanger the lives of patient and emphasize pressure for his family. In addition, this mistake will consume manpower and timing wastefully.

AIM

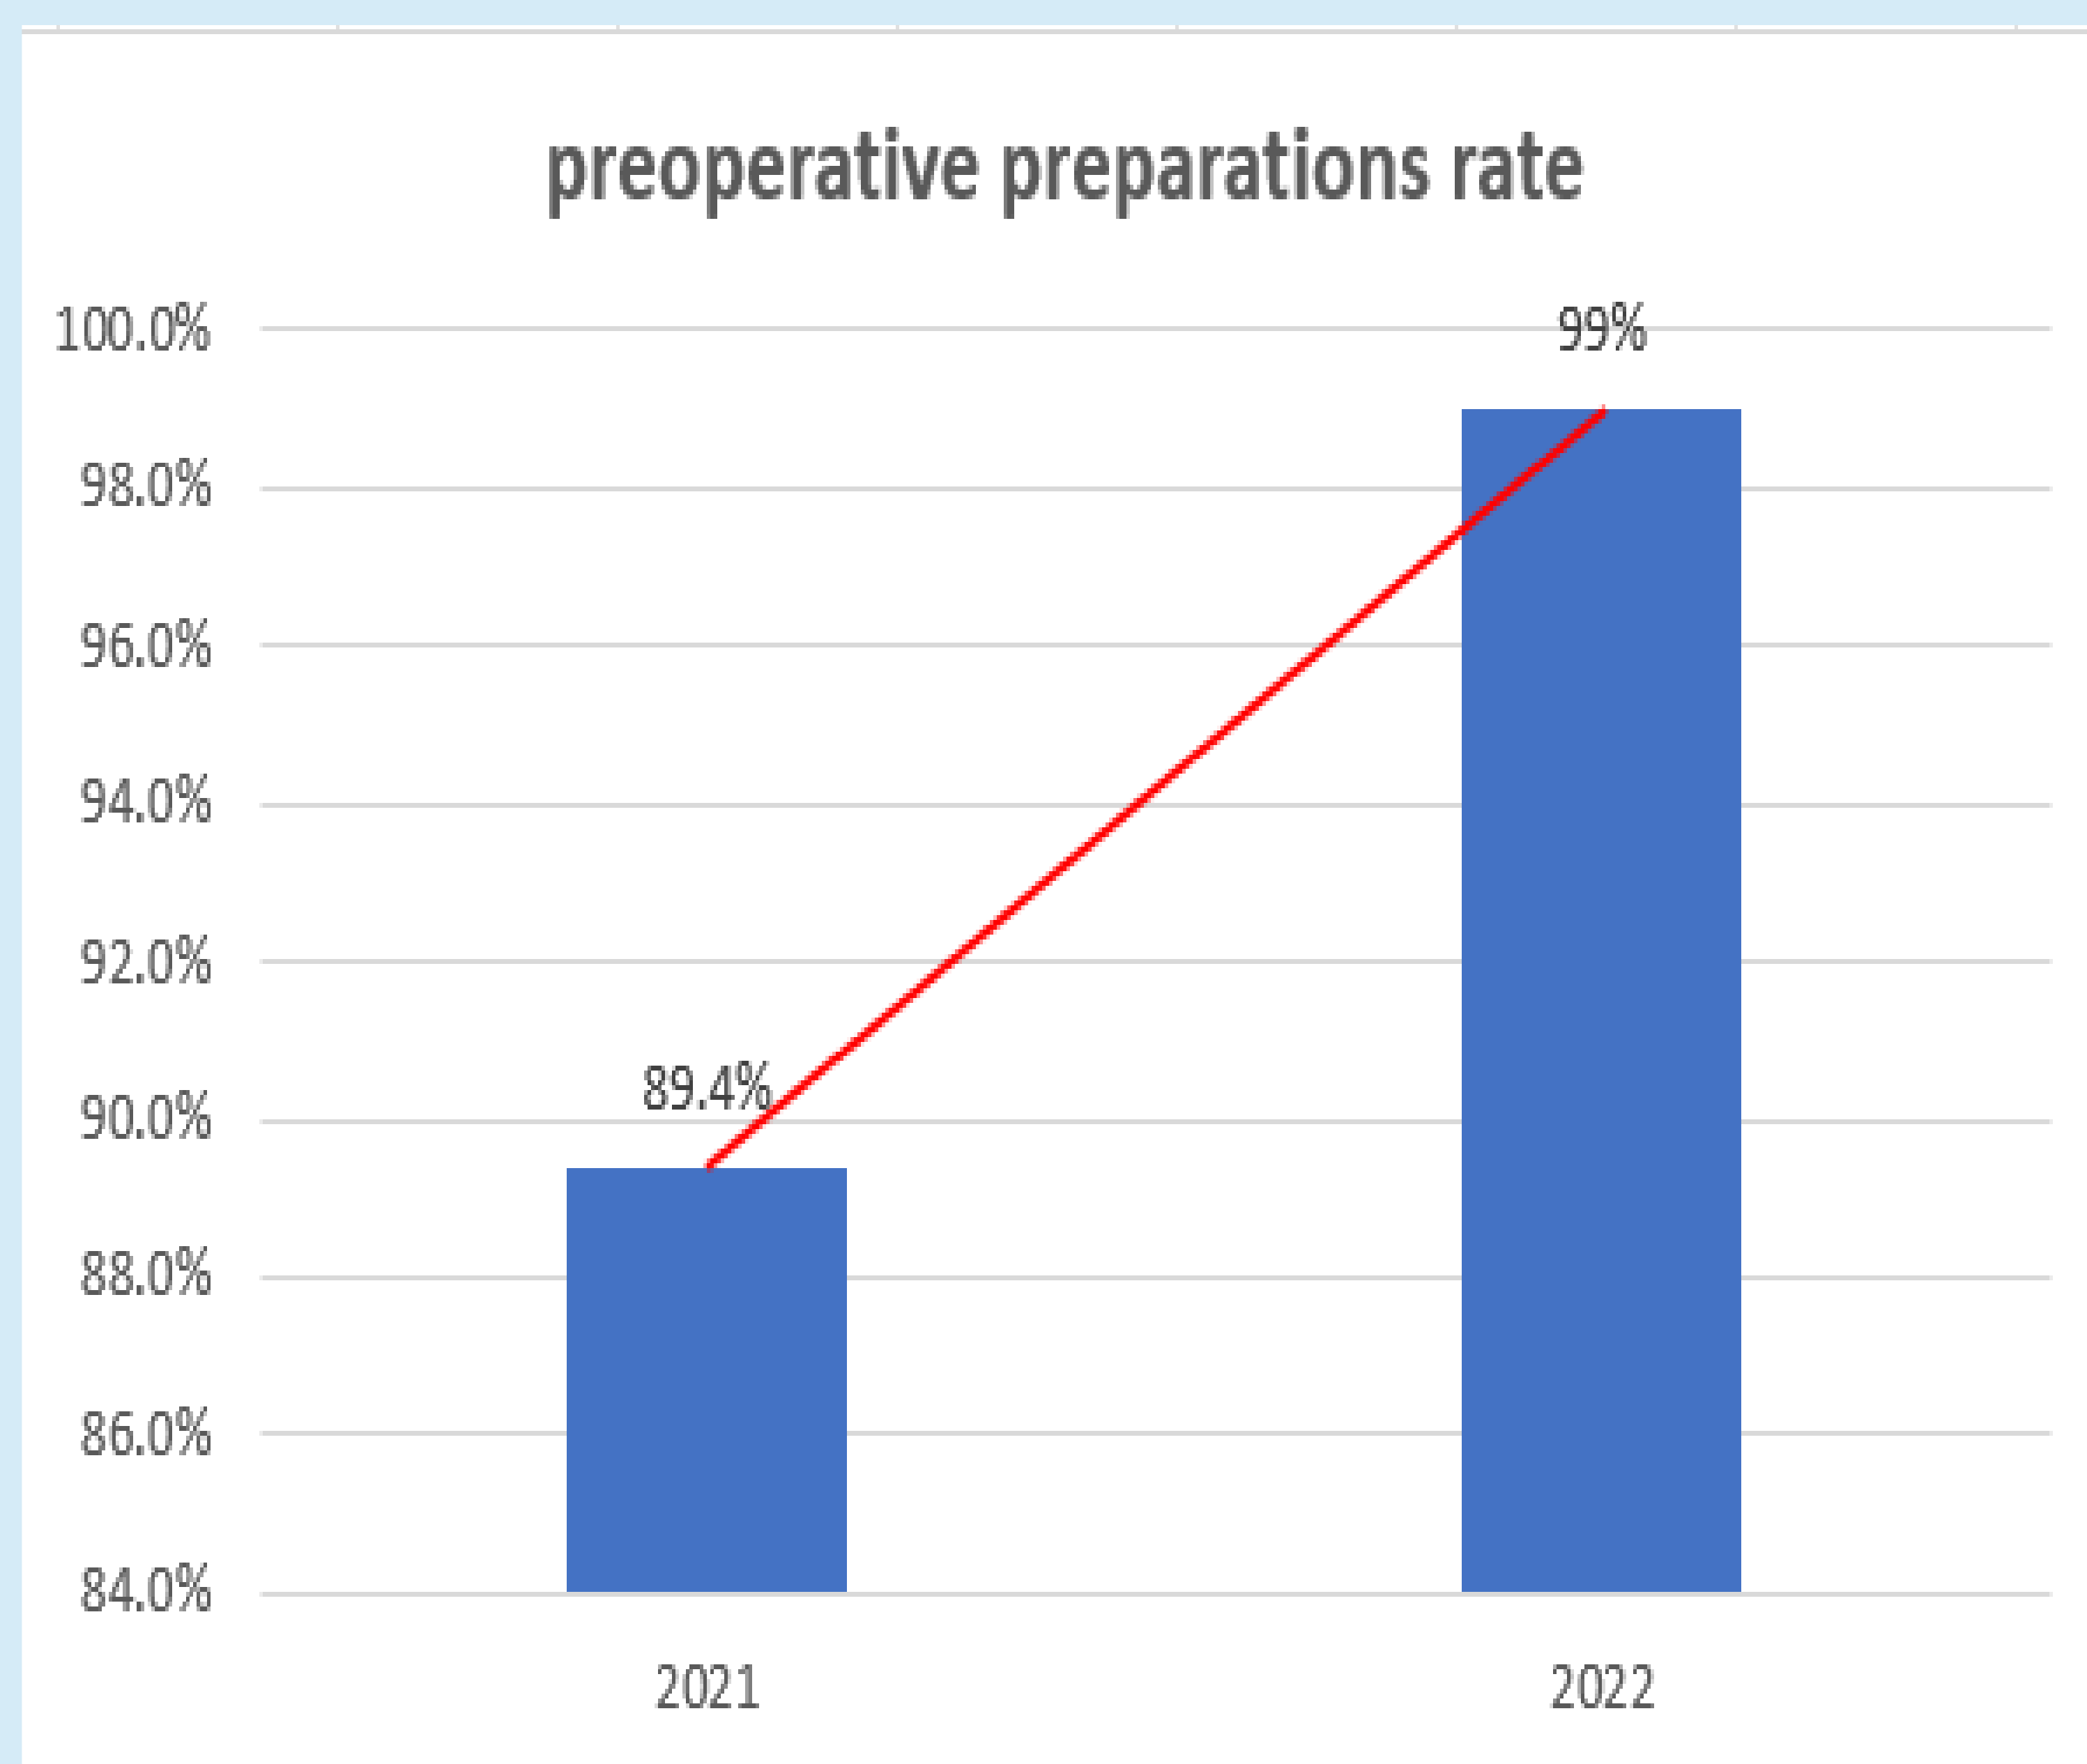

Preparation before surgery is quite common in orthopedic wards. At least 200 surgeries are performed every month. It is a skill that nurses in the ward should have. However, in 2021, the complete rate of pre-operative preparation in the orthopedic ward is only 89.4%. To ensure the safety of patients, an improvement plan is implemented, and it is expected to increase the complete rate of preoperative preparation.

METHOD

In the 2021, the rate of presurgery preparations of orthopedic ward was 89.4% only. To make sure the safety of patients during surgery. Our method is prepare for questionnaire 、humanoid figure and operation checklist. Those tools are used by evaluation for process cognition. Furthermore, build amusing education for training courses and invite patients to participate health education for pre-surgery preparations.

RESULTS

After implementation as methods. The presurgery preparations improve to 99% in 2022.

CONCLUSIONS

The purpose of this project is to improve the completion rate of preoperative preparations for patients in orthopedic wards, understand the reasons for abnormal preoperative preparations through current situation analysis, and understand the current situation of personnel cognition through the preoperative preparations cognition questionnaire, and review the preoperative preparations by making a human figure checklist Standardized operating standards, on-the-job education and training courses and health education courses have effectively improved the completion rate of preoperative preparation for patients in the ward, fulfilled the goal of patient safety during surgery, and made nursing staff understand and pay more attention to the importance of pre-operative preparation.
