Incidence of pre-eclampsia in a cohort of surrogacy pregnancies at a fertility clinic in Colombia.

Camacho AM. Fetal Medicine Experts

Introduction

To determine the incidence of pre-eclampsia in a cohort of surrogacy pregnancies at a fertility clinic in Colombia..

Methods:

We made a prospective descriptive study, to determine the incidence of pre-eclampsia in pregnancies who went to fertility treatment with a surrogate mother in a fertility center in Bogotá.

Results:

A total of 49 pregnant women were treated. 29 percent (13 of 49) of pregnant developed pre-eclampsia that is three times the incidence of the country .

Conclusion

Surrogacy is a risk factor for pre-eclampsia. Further controlled studies are needed to confirm these findings.
