1.Department of Obstetrics and Gynaecology, The Chinese University of Hong Kong; 2.Fetal Brain Center, CRIFM Prenatal Medical Clinic

Objective: To (1) evaluate the normal development of the fetal corpus callosum (CC) between 18 and 32 weeks' gestation using three-dimensional (3D) transvaginal neurosonography.

- A total of **956** cases: **815** Japanese; **141** Chinese
- GA: 18⁺⁰-32⁺⁶ weeks
- CRIFM Prenatal Medical Clinic, Japan
- Prince of Wales Hospital, CUHK, Hong Kong SAR

Region-specific non-linear growth patterns in fetal corpus callosum development from 18 to 32 weeks, with posterior-predominant area expansion most pronounced in the splenium. These trajectories should be regarded purely as descriptive tools rather than reference ranges for isolated clinical decision-making
