

Esthetic challenge for restoring facial support in severe bone resorption case

case studies

Kimberly H Kim DDS, MsD, PhD

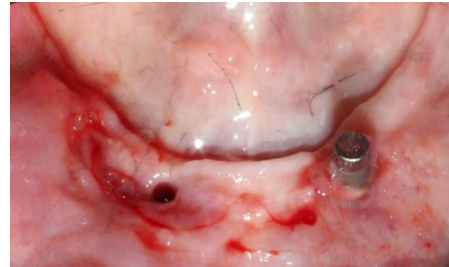

Severe bone loss from failed implants

- This case lists things we need to be in mind when we start the severe bone loss case but has very high esthetic demand
 - Without understanding the patient's full esthetic expectation, successful implant treatment can't be achieved
-

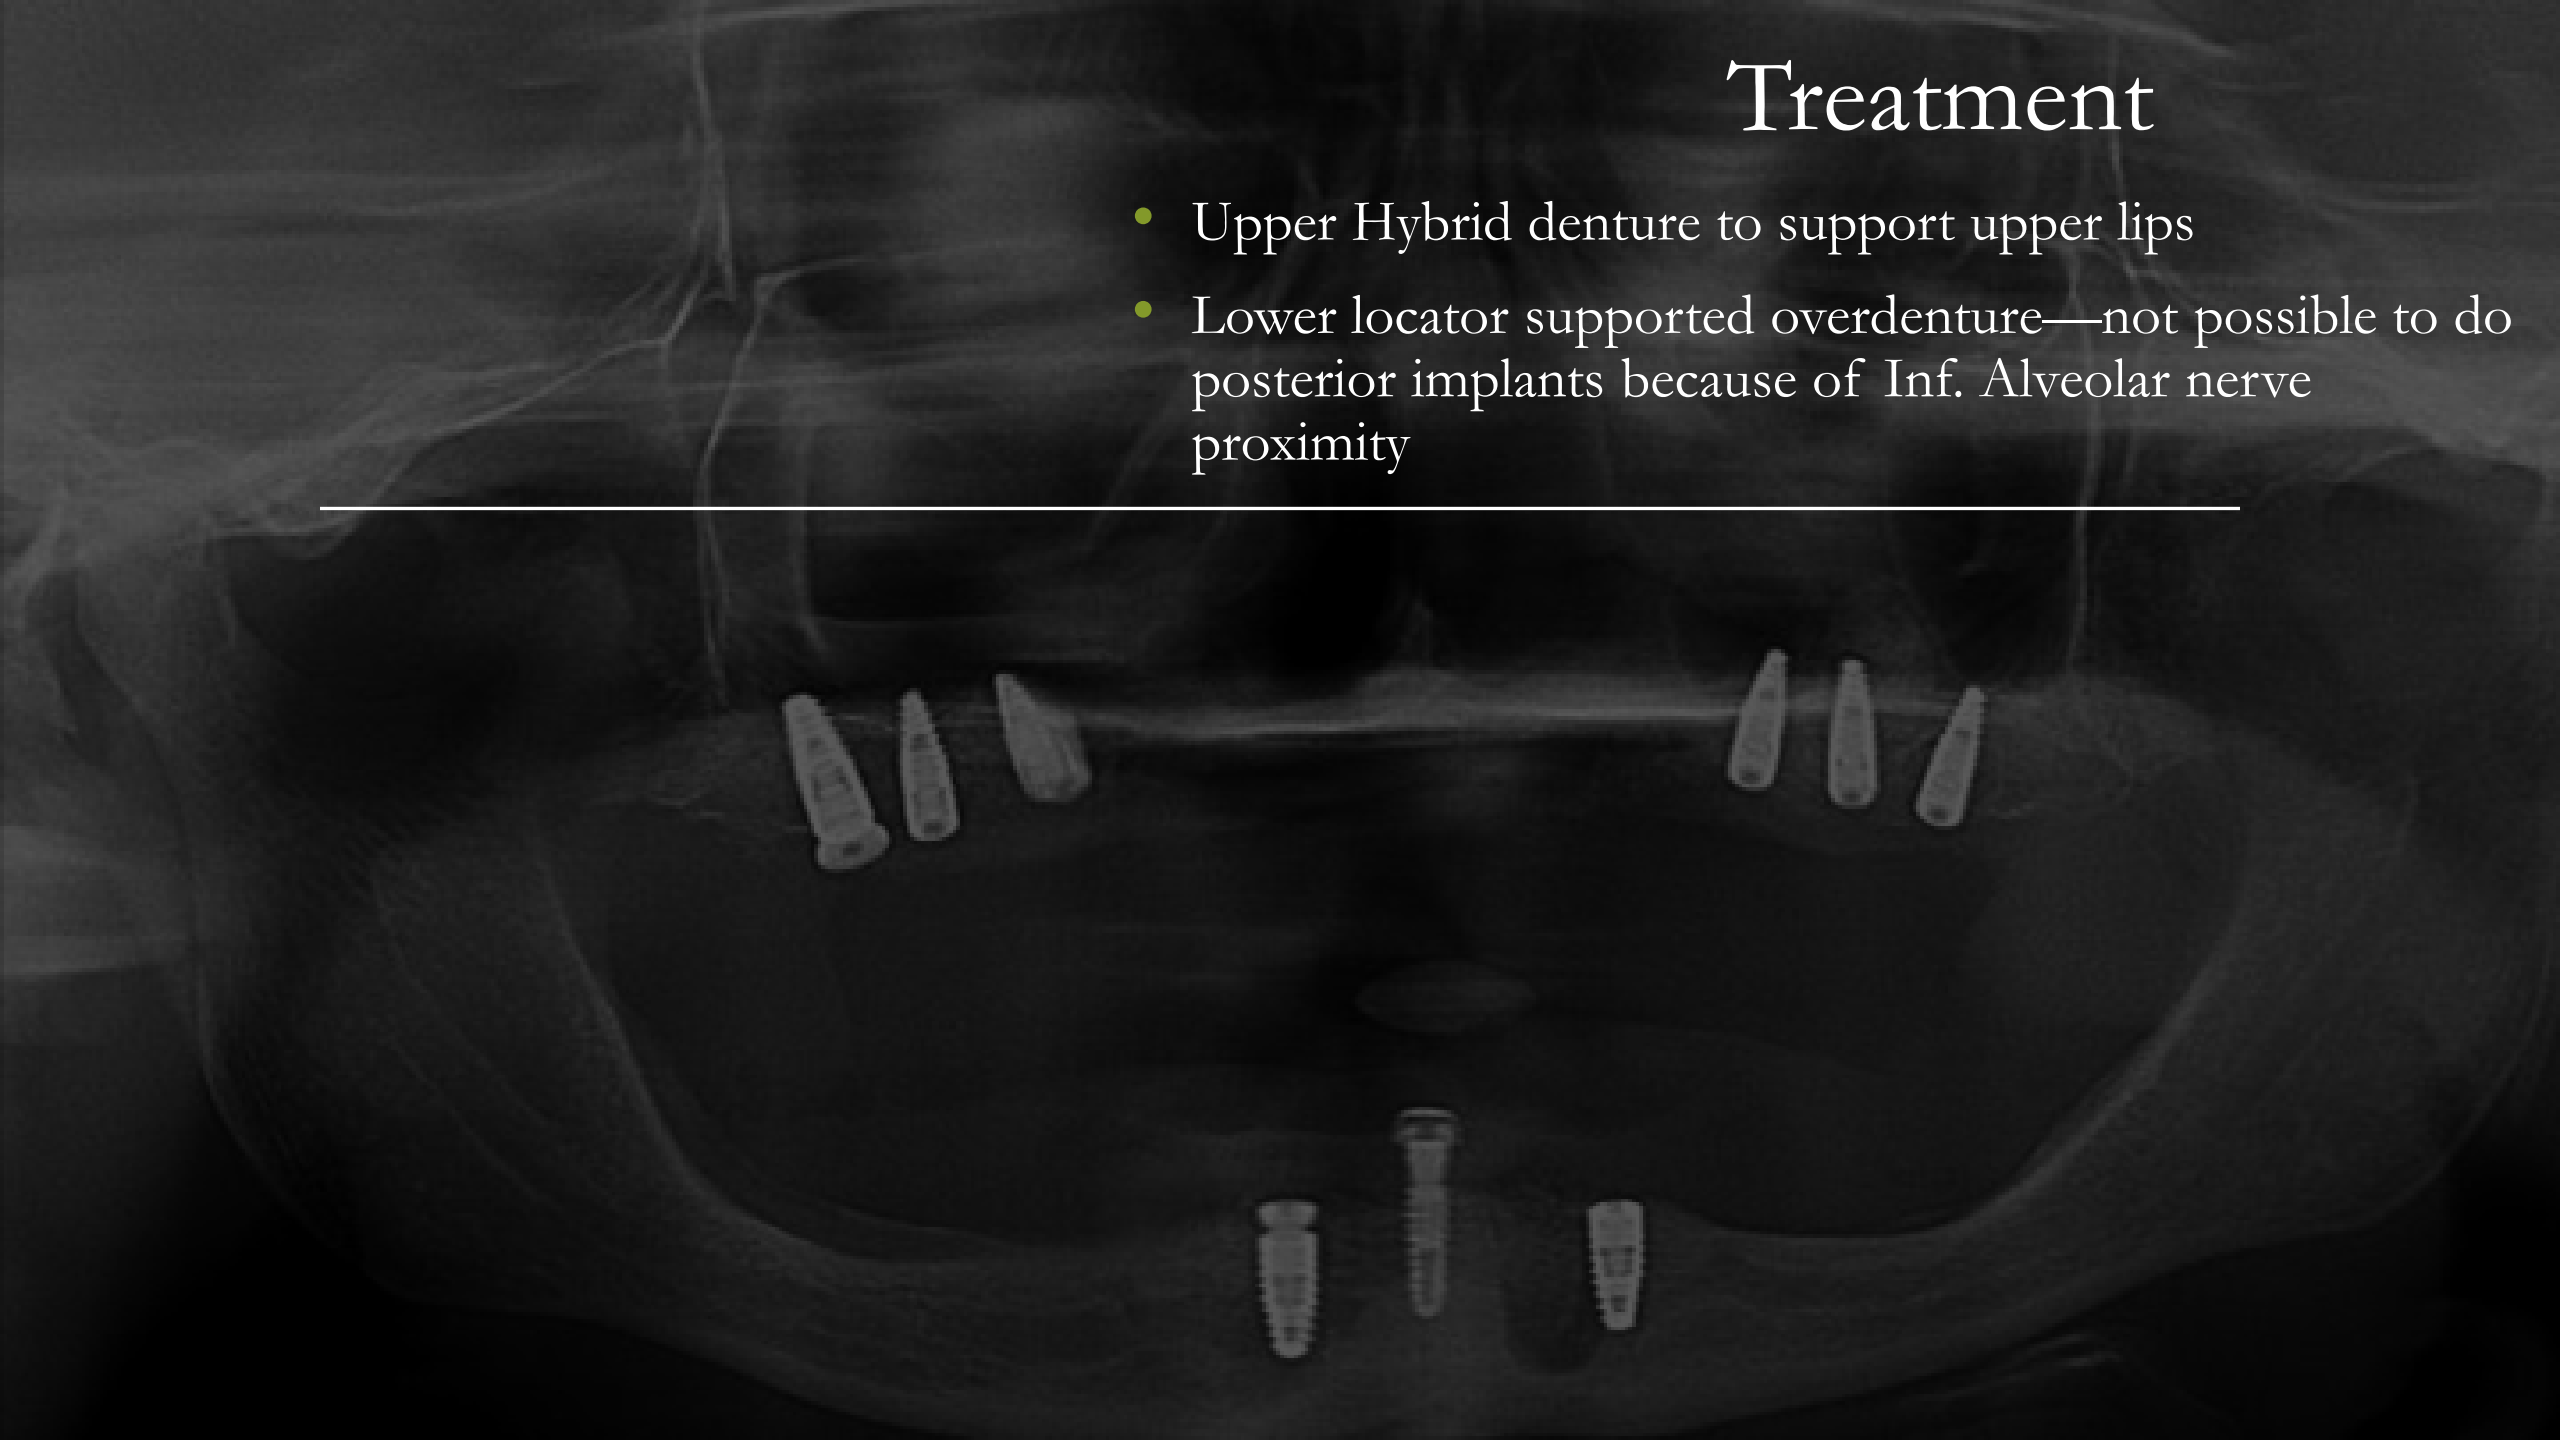

Before

- Failed fixtures were part of her removable dentures
- With OTC denture glue, pt was wearing the denture with the failed fixtures together
- When pt took out the denture, bleeding happens
- Constant infection origin

Treatment

- Upper Hybrid denture to support upper lips
 - Lower locator supported overdenture—not possible to do posterior implants because of Inf. Alveolar nerve proximity
-

Challenges

- Pt age was 60 but she brought her photo in her twenties after several teeth try in
- Doesn't accept soft tissue change and hard tissue severe loss
- She brought this photo at the end of restoration phase
- Without patients' realistic expectation, hard to achieve successful treatment result
- Before the case started, pt's expectation should be measured and without patient's full understanding, better not to start the case
