Introduction

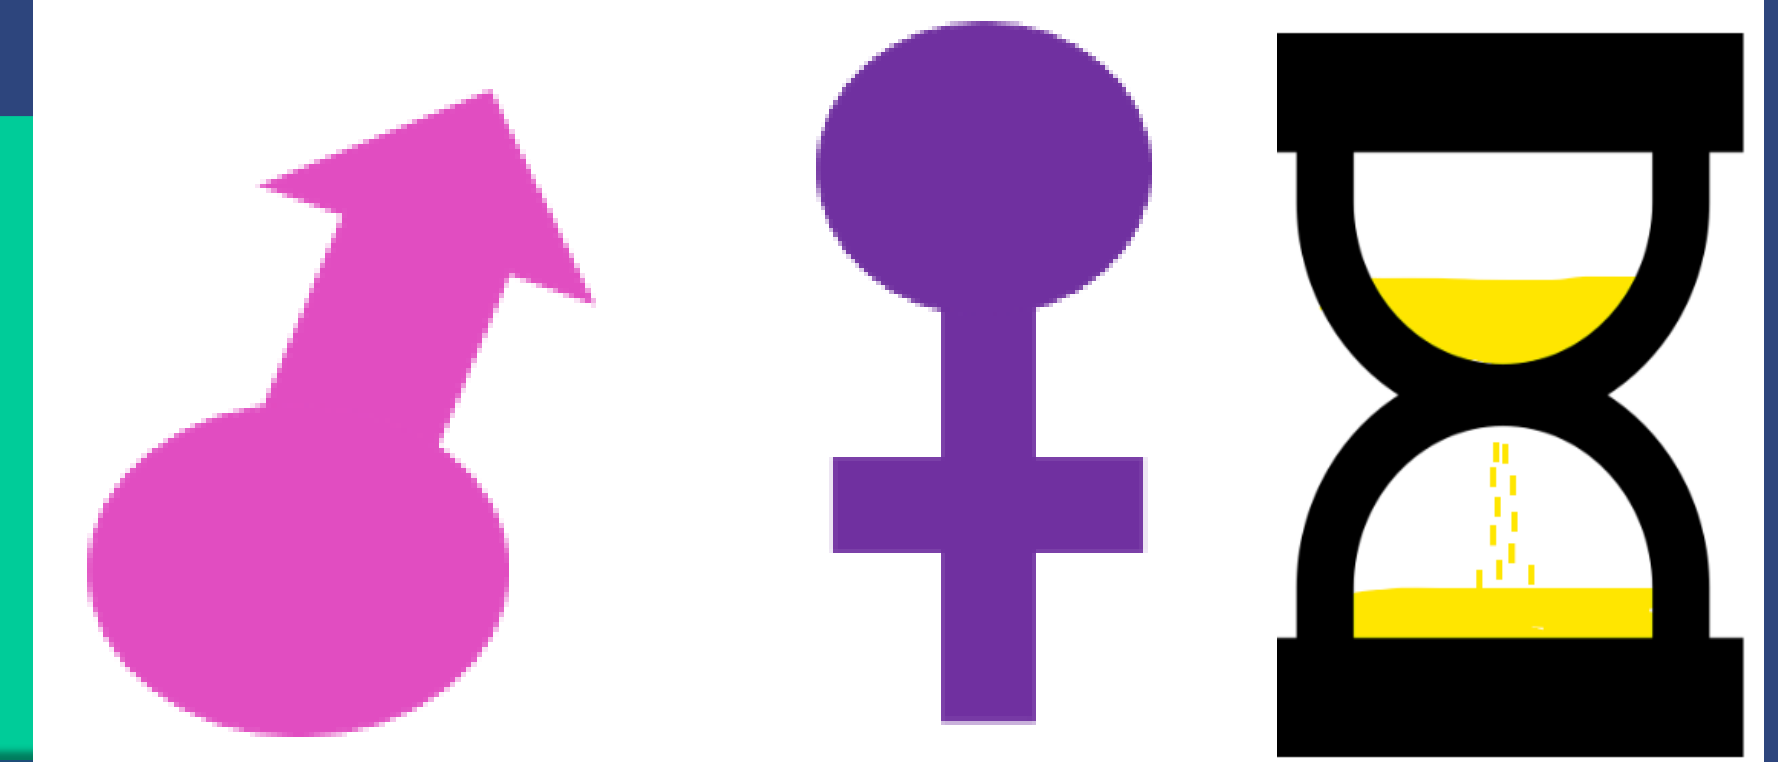

INCATIV is a research program carried out by nurses on 34 hospital of the Region of Valencia (Spain). This program measures vascular access quality on patients of these hospitals via cross-sections. The objective of the study is to evaluate the influence of COVID-19 pandemic in the registers of the vascular accesses' quality program.

Material and Methods

Quantitative observational, analytical, and retrospective study of two cross-sections. First cross-section was developed before pandemic (C10: 02-2020) and second cross-section during pandemic (C11: 05-2020). Data was obtained from INCATIV's platform

Results

10	56 %	44%	67
11	58 %	42%	65

Conclusion

Clinical characteristics' patients and nursing care have experienced changes due to SarsCoV-19 pandemic, influencing strongly on the percentage of participation as on the number of registers of this quality program focused on intravenous therapy. However, it must be highlighted how some of the variables measured included at INCATIV bundle, reflect that nursing care quality remains constant
