

CUSA081 (Reteplase) for the Treatment of Central Venous Access Device Occlusions

Michael Wright¹; Giovanni Piotti²

1 Williamson Medical Center, Franklin, TN, USA; 2 Chiesi Farmaceutici S.p.A. Parma, Italy

Background

Introduction

- Dysfunction of Central Venous Access Devices (CVADs) is a serious complication that causes delay in therapy administration, prolonged hospitalization, patient discomfort and increased costs
- Thrombotic occlusion is the most frequent cause of CVAD dysfunction
- Thrombolytic agents successfully restore the patency of occluded CVADs in up to 80% of cases, and are endorsed by current guidelines as a first-line treatment¹
- Currently, the tissue plasminogen activator (tPA) Alteplase (Cathflo)² is the only thrombolytic agent available on the US market approved by the FDA for the restoration of function of CVADs

Reteplase for treatment of dysfunctional CVADs

- Reteplase is a 3rd generation recombinant tPA,
- Reteplase lacks the fibronectin-like finger domain of alteplase that confers high fibrin binding affinity (Fig. 1)

Figure 1. Molecular structure of alteplase compared to reteplase

- Compared to alteplase, reteplase binds less tightly to fibrin, thus penetrating deeper in the clot and potentially being more rapid in lysing clots³
- Preliminary studies found that reteplase is highly effective at restoring CVAD patency when instilled within the catheter at a dose of 0.4 units⁴⁶
- Chiesi Farmaceutici S.p.A. (Chiesi) has defined a clinical development program, namely READY, composed of 2 Phase3 studies and 1 pediatric study with the aim to develop reteplase for the restoration of function to dysfunctional CVADs
- The program has been agreed with the FDA
- The formulation of reteplase under development for this indication is CUSA-081 (0.4 units of reteplase/2 ml)

READY-1: Study Design

- READY 1 is a phase III, multicenter, randomized, double-blind, parallel-group, active- and placebo-controlled study examining the use of CUSA-081 (reteplase) vs placebo or alteplase for the treatment of dysfunctional non-hemodialysis CVADs
- It is sponsored by Chiesi Farmaceutici S.p.A. (NCT03594175)
- It plans to randomize 841 adults across 100 sites in 8 countries in Europe, South, and North America (Fig. 2)

Figure 2. Study site countries for READY-1 Study

Key inclusion criteria

- Implanted CVAD (single or multi-lumen, implanted port, or peripherally inserted central catheter) in place for > 24 hours and documented as previously patent.
- Inability to have 3 ml of blood withdrawn.

Key exclusion criteria

- CVAD used for hemodialysis.
- CVAD known to be dysfunctional for >48 hours.
- Known non-thrombotic occlusion.
- Known or suspected catheter related blood stream infection.
- Known high risk of bleeding or embolic complication.

Randomization

- Subjects will be randomized after screening and eligibility confirmation with an allocation ratio of 9 to CUSA-081, 1 to placebo, 6 to alteplase (Fig. 3)

Figure 3. Randomization plan for READY-1

READY-1: Study Methodology

Blinded Study Drug

- Up to 2 intra-catheter instillations of the blinded study drug are foreseen (Fig. 4)

Treatment Arm	Syringe 1	Syringe 2
	Given at minute 0 Assessed at minutes 30, 60, 90	Given, if needed, at minute 90 Assessed at minutes 120, 150, 180
A	CUSA-081 0.70mg (0.4 units) / 2 mL	CUSA-081 0.70mg (0.4 units) / 2 mL
B	Placebo 2 mL normal saline (0.9%)	Placebo 2 mL normal saline (0.9%)
C	Alteplase 2 mg/ 2 mL	Alteplase 2 mg/ 2 mL

Figure 4. Investigational drug dosing and sequence

Study Plan and Evaluation of CVAD patency (Fig. 5)

- Restoration of CVAD patency is defined as the ability to have 3 ml of blood withdrawn and 5 ml of saline infused from the dysfunctional CVAD lumen
- Procedures and timepoints for CVAD assessments are indicated in Fig. 5

Figure 5. Study Plan and Evaluation of CVAD Patency for READY-1 Study

Primary efficacy endpoint

- To demonstrate the superiority of CUSA-081 compared to placebo in the rate of treatment success following a single administration with a dwell time up to 90 min

Key secondary endpoint

- To demonstrate noninferiority of CUSA-081 vs alteplase with a dwell time up to 90 min

Further important endpoints

- To evaluate the safety and tolerability of CUSA081.
- To evaluate the rate of catheter re-occlusion within 30 days

READY-1: Recruitment Status

- The first patient was randomized in Feb 2020
- Study recruitment has been hindered by COVID pandemic
- 379 participants have been randomized as of 19.Sep.2022
- Study completion is now expected in the first half of 2025 (Fig. 6)

Figure 6. Global READY-1 randomization status

- 26.2% of READY-1 study participants have been randomized in US, 15% in Latin America and in 58.8% in Europe (Fig. 7)

Figure 7. Proportion of READY-1 participants by Country
